DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM FOUR

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel

Lessons revised: Part 1: Form 3 syllabus (Mr Kamdem, up to lesson 30); Part 2: Form 4 syllabus (Mr Tabit)

PART 1: MR KAMDEM'S LESSONS (FORM 3 SYLLABUS, UP TO LESSON 30): QUESTIONS TO ASK THE STUDENTS

These are the parts of the Form 4 paper that come from your lessons: soil formation (MCQ 1), terraces and cover against soil loss (MCQ 3, Task 3), barchans (MCQ 7) and water in the hot desert (MCQ 8).

A. WEATHERING AND SOIL (LESSONS 15 TO 17 AND FURTHER STUDY 2)

1. Which three kinds of processes break rocks down to form soil?

Answer: Physical (mechanical), **chemical** and **biological** processes (roots, burrowing animals, lichens and bacteria).

2. Give one example of physical weathering and one of chemical weathering.

Answer: Physical: frost shattering or thermal shattering (exfoliation). Chemical: carbonation, oxidation, hydrolysis, solution or hydration.

3. What is soil and what is it made of?

Answer: The loose top layer of the land where plants grow. It is made of **mineral particles** (weathered rock), **organic matter** (humus), **water and air**.

4. How does weathering harm the soil and the land on slopes?

Answer: Heavy rain washes the plant food out of the soil (**leaching**), so it loses its fertility; weathered material slides down slopes (**mass movement**) and destroys farms, roads and houses.

5. Name two measures that protect the soil on a slope.

Answer: Plant cover (trees and grass hold the soil) and **terraces** (flat steps that slow down running water).

B. HOT DESERTS (LESSONS 27 TO 29)

6. What is a hot desert? How much rain does it receive a year?

Answer: A hot region with less than **250 mm** of rain per year (a semi-arid region has 250 to 500 mm).

7. Name three dry regions of Africa.

Answer: The Sahara, the Namib, the Kalahari, the Sahel (which includes the Far North of Cameroon), parts of the Horn of Africa.

8. What are the three processes of wind erosion?

Answer: Deflation (the wind removes loose sand and dust), **abrasion** (sand thrown by the wind wears rocks) and **attrition** (sand grains hit one another and become smaller).

9. Name three erosional features of the wind.

Answer: Inselbergs, **rock pedestals**, **yardangs**, zeugen, deflation hollows.

10. Why does the wind drop its sand? Name the features it forms.

Answer: The wind slows down, meets an obstacle, or the sand is wet. Features: **sand dunes**, sand sheets, ripples, loess.

11. Name the two types of sand dunes. Which one is crescent-shaped?

Answer: Barchans (crescent-shaped, horns pointing downwind) and **seif dunes** (long, straight ridges parallel to the wind). The crescent-shaped one is the **barchan**.

12. What is the main problem of people in the hot desert and how do they solve it?

Answer: The problem is the **lack of water** (less than 250 mm of rain; wells dry up). Solutions: dig wells and boreholes, **store water**, irrigate crops with river water (Nile), farm at oases; plant trees (Great Green Wall) against the spreading desert.

PART 2: MR TABIT'S LESSONS (FORM 4 SYLLABUS): QUESTIONS AND ANSWERS, IF TIME ALLOWS

13. What is soil erosion? What is accelerated erosion?

Answer: Soil erosion is the removal of the topsoil by water, wind or people. **Accelerated erosion** is erosion made very fast by human activities; **normal (geologic) erosion** is slow and natural.

14. Name human activities that cause soil erosion.

Answer: Deforestation, overgrazing, bush fires, ploughing up and down slopes, over-cultivation on steep slopes.

15. Name methods of soil conservation.

Answer: Terracing, contour ploughing, **strip cultivation** (strips of crops across the slope), **windbreaks**, cover crops, mulching, crop rotation, manure.

16. What is an ecosystem? Which organisms make their own food? How much energy passes to the next level?

Answer: A natural area where living and non-living components interact. **Producers** (green plants) make their own food from solar energy. Only about **10 %** of the energy passes to the next trophic level.

17. Where is Cameroon located and what are its relief units?

Answer: Between **2° N and 13° N** and 8° E and 16° E. Highlands: Western Highlands, Adamawa Plateau, Mandara Mountains, South Cameroon Plateau. Lowlands: Coastal lowlands, Benue lowland, Chad Plain.

18. From a climate table, how do you find the annual range of temperature and the wettest month?

Answer: Range = highest − lowest monthly temperature. Wettest month = the month with the highest rainfall. Total rainfall = sum of the 12 months.

Practice: study the climate data of a station W in Africa (approximate values).

Month	J	F	M	A	M	J	J	A	S	O	N	D
Temp. (°C)	25	27	29	29	27	25	24	24	24	25	26	25
Rain (mm)	0	2	15	60	140	170	200	230	180	70	5	0

19. Station W: calculate the annual range, name the wettest month and the biome, with two reasons.

Answer: Range = 29 − 24 = **5 °C**. Wettest month: **August** (230 mm). Biome: **savanna (tropical wet and dry)**: hot all year with a small range, one long rainy season (May to October) and a long dry season, about 1,070 mm of rain.

20. Competence: a widow's farm on a steep hill slope loses soil to wind and rain and her yields fall. State the problem, two causes and two measures.

Answer: Problem: soil erosion. **Causes**: farming a steep slope without protection; clearing the plant cover; heavy rain and strong winds. **Measures**: terracing or contour ploughing; windbreaks, cover crops and mulching.
