

DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM TWO TECHNICAL

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel

Lessons revised: Lesson 1: The equatorial region (location, climate, soils, vegetation, resources, activities, problems)

A. LOCATION AND CLIMATE OF THE EQUATORIAL REGION

1. Where is the equatorial region located? Give examples.

Answer: Between about 5° N and 5° S of the Equator: the Congo Basin (including southern Cameroon), the Amazon Basin and South-East Asia (Indonesia, Malaysia).

2. Give five characteristics of the equatorial climate.

Answer: Hot all year (about 27 °C); very small annual range of temperature (2 to 3 °C); heavy rainfall (above 1,500 mm) falling all year; two rainy seasons; high humidity and convectional rain in the afternoon.

Practice: study the climate data of a station Y in southern Cameroon (approximate values).

Month	J	F	M	A	M	J	J	A	S	O	N	D
Temp. (°C)	25	25	25	25	24	24	23	23	24	24	24	25
Rain (mm)	40	80	150	190	210	160	60	90	230	280	130	40

3. Calculate the annual range of temperature and the total annual rainfall.

Answer: Range = highest – lowest = 25 – 23 = 2 °C. Total rainfall = sum of the 12 months = 1,660 mm.

4. Name the wettest month and state two characteristics of the equatorial climate shown.

Answer: Wettest month: **October** (280 mm). It is hot all year with a very small range (2 °C), rainfall is heavy (above 1,500 mm) and there are two rainy seasons (March–June and September–November).

B. SOILS AND VEGETATION

5. Describe the equatorial soils.

Answer: They are red or yellow **ferrallitic** soils. Heavy rain washes the nutrients down (**leaching**), so they become poor once the forest is cleared.

6. Give four characteristics of the equatorial forest.

Answer: It is dense and **evergreen** (trees shed their leaves at different times); it has several layers, with emergent trees of 50 to 60 m; it has hardwoods (mahogany, sapele, iroko, ebony, ayous), lianas and buttress roots; there is little undergrowth because little light reaches the ground.

C. RESOURCES, HUMAN ACTIVITIES AND PROBLEMS

7. Give three resources of the equatorial region.

Answer: Timber and other forest products; wildlife; minerals and oil; rivers for fishing and hydroelectricity.

8. Give three human activities of the equatorial region.

Answer: **Lumbering**; shifting cultivation; plantation agriculture (cocoa, oil palm, rubber); hunting and gathering; mining.

9. Give three problems of the equatorial region.

Answer: **Deforestation**; leaching and poor soils; diseases such as malaria; poor roads and communication in the dense forest.

Quick quiz	Answer
Washing down of soil nutrients by heavy rain	Leaching
A hardwood of the equatorial forest	Mahogany
A human activity of the equatorial region	Lumbering
Average temperature of the equatorial region	About 27 °C

D. PRACTICE OF COMPETENCE

Situation

Near Lomié, farmers clear new forest plots every two years because their old fields no longer produce enough. The chief does not understand why the soil becomes poor so quickly.

10. What is the problem raised in the situation?

Answer: The soils become poor quickly after the forest is cleared, which pushes farmers to destroy more forest (deforestation).

11. Propose three measures to solve it.

Answer: Practise agroforestry and plant cover crops; add compost or manure to the soil; replant trees and protect the remaining forest; leave the land to rest (fallow).

Exam tip: In Part Two, Question 1 asks for the problem of the situation, Question 2 is answered with **Document 1**, and Question 3 asks you to propose your own solutions. **Document 2 has nothing to do with the situation: do not use it.**
