

DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM THREE

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel

Lessons revised: Lesson 1 (Our Planet, the Earth), Further Study 1 (Universe and Moon), Lesson 2 (Latitudes and Longitudes)

A. OUR PLANET, THE EARTH

1. What is the position of the Earth in the solar system?

Answer: The Earth is the **third planet** from the Sun, between Venus and Mars.

2. Describe the shape and the size of the Earth.

Answer: The Earth is a **sphere slightly flattened at the poles**. Its circumference at the Equator is about **40,000 km**, its diameter about 12,700 km and its surface area about 510 million km².

3. Give four proofs that the Earth is spherical.

Answer: Ships disappear gradually below the horizon (the hull first); the shadow of the Earth on the Moon during an eclipse is round; photographs from space show a round Earth; travellers can go round the Earth; the horizon gets wider when we climb higher.

B. THE UNIVERSE AND THE MOON

4. What is the universe and what does it contain?

Answer: It is all of space and everything in it: galaxies (such as the **Milky Way**), stars (such as the Sun), planets, satellites and comets.

5. What is the Moon? Name its main phases.

Answer: The Moon is the **natural satellite** of the Earth. It has no light of its own: it reflects the light of the Sun. Phases: new moon, crescent, first quarter, **full moon** (whole lit face visible), last quarter. A full cycle lasts about 29.5 days.

6. Give two influences of the Moon on the Earth and its people.

Answer: It causes the **tides** of the sea; it lights the night; it is used for calendars and religious feasts (Ramadan); fishermen use its phases.

C. LATITUDES AND LONGITUDES

7. Define latitude and longitude.

Answer: **Latitude:** the distance of a place north or south of the Equator, in degrees. **Longitude:** the distance of a place east or west of the Greenwich Meridian, in degrees.

8. Name the major lines of latitude with their values.

Answer: Equator 0°; Tropic of Cancer 23½° N; Tropic of Capricorn 23½° S; Arctic Circle 66½° N; Antarctic Circle 66½° S; North and South Poles 90°. The Greenwich (Prime) Meridian is longitude 0°.

9. Give two differences between lines of latitude and lines of longitude.

Answer: Latitudes (**parallels**) run east–west and are parallel to the Equator; longitudes (**meridians**) run from pole to pole. Latitudes get shorter towards the poles; all longitudes have the same length. Latitudes go from 0° to 90° N/S; longitudes from 0° to 180° E/W.

10. How do you read the geographical coordinates of a town on a map?

Answer: Follow the line of latitude to the side of the map and read its value with N or S; follow the line of longitude to the top or bottom and read its value with E or W. Write the latitude first: Ngaoundéré is about 7° N, 13° E; Yaoundé about 4° N, 12° E.

11. Town A is on latitude 13° N and town B on latitude 4° S, on the same meridian. Calculate the distance between them (1° = 111 km).

Answer: The towns are on opposite sides of the Equator, so we **add**: 13 + 4 = 17°. Distance = 17 × 111 = **1,887 km**. (If both were in the same hemisphere, we would subtract.)

Quick quiz	Answer
Natural satellite of the Earth	The Moon
Latitude 0° is called the ...	Equator
Lines of longitude are also called ...	Meridians
Circumference of the Earth at the Equator	About 40,000 km

D. PRACTICE OF COMPETENCE

Situation

Your little cousin sees that the Moon is round one week and thin like a banana another week. She thinks that the Moon breaks into pieces and asks you to explain.

12. What is the problem raised in the situation?

Answer: Your cousin does not understand the **phases of the Moon** and believes that the Moon really changes its shape.

13. Propose three ways to help her understand.

Answer: Explain that the Moon reflects the light of the Sun and that, as it moves round the Earth, we see a different part of its lit face; observe the Moon with her every evening for a month and draw its shapes; show her a lamp and a ball to imitate the phases.

Exam tip: In Part Two, Question 1 asks for the problem of the situation, Question 2 is answered with **Document 1**, and Question 3 asks you to propose your own solutions. **Document 2 has nothing to do with the situation: do not use it.**
