

DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM FOUR

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel
Lessons revised: Physical geography: biomes and climate data, soils, soil erosion and conservation

A. READING CLIMATE DATA AND IDENTIFYING BIOMES

1. How do you calculate the annual range of temperature, the total rainfall and find the wettest month?

Answer: Annual range = highest monthly temperature – lowest monthly temperature (°C). Total rainfall = sum of the 12 monthly figures (mm). The wettest month is the month with the highest rainfall.

2. Give the main characteristics of the tropical wet and dry (savanna) climate.

Answer: Hot all year (25 to 33 °C), with the highest temperatures just before the rains; rainfall of about 750 to 1,500 mm; **one rainy season** (summer) and a **long dry season** of 5 to 7 months; annual range of about 5 to 8 °C. Example: Garoua.

3. Describe two adaptations of savanna vegetation to the long dry season.

Answer: Trees such as the baobab store water in their thick trunks; many trees shed their leaves in the dry season to reduce water loss; trees have deep roots and thick bark against fires; grasses dry up above the ground and grow again with the first rains.

Practice: study the climate data of a station Z (approximate values).

Month	J	F	M	A	M	J	J	A	S	O	N	D
Temp. (°C)	14	16	20	25	29	33	34	33	30	25	19	15
Rain (mm)	5	3	2	0	0	0	0	0	0	1	3	6

4. Calculate the annual range of temperature and the total rainfall of station Z.

Answer: Range = 34 – 14 = **20 °C**. Total rainfall = **20 mm**.

5. Name the biome of station Z and give two reasons.

Answer: **Hot desert** biome: the rainfall is very low (20 mm, far below 250 mm), and the annual range of temperature is very large (20 °C) with very hot summers.

6. Compare the main biomes studied.

Answer: Equatorial: hot and wet all year, range 2–3 °C, evergreen forest. Savanna: one rainy and one dry season, grassland with scattered trees. Monsoon: heavy summer rains and dry winter. Hot desert: below 250 mm, very large ranges, sparse xerophytic plants. Mediterranean: hot dry summers and mild wet winters.

B. SOIL EROSION AND SOIL CONSERVATION

7. Define soil erosion and name its types.

Answer: Soil erosion is the **removal of the top soil** by water, wind or human activities. Types: sheet erosion, rill erosion, gully erosion and wind erosion.

8. Explain three human activities that cause soil erosion in Cameroon.

Answer: **Deforestation and bush fires** leave the soil bare, so rain washes it away. **Overgrazing** by cattle in the north destroys the grass cover. **Farming up and down slopes**, as on the hills of the West, lets water run quickly and carry the soil.

9. Describe three methods of soil conservation used by farmers in Cameroon.

Answer: **Terracing** on steep slopes, as in the Mandara Mountains, slows down runoff. **Contour ploughing** makes ridges across the slope that hold water. **Afforestation, cover crops and mulching** protect the soil from rain and wind. Crop rotation, manure and controlled grazing also keep the soil fertile.

10. Why is soil erosion a serious problem?

Answer: It removes the most fertile layer of the soil, so harvests fall; it forms gullies that destroy fields and roads; the soil carried away silts rivers and reservoirs such as Lagdo.

Exam tip: In GCE questions, “**State**” asks for short points; “**Explain**” and “**Describe**” need a full sentence for each point, with an example from Cameroon. Always show your working in calculations and give the unit (°C, mm).
