DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM TWO TECHNICAL

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel

Lessons revised: Lesson 1: The equatorial region; Lesson 2: The tropical grassland region (climate, vegetation and soils)

A. THE EQUATORIAL REGION: LOCATION AND CLIMATE

1. Where is the equatorial region located?

Answer: Between **5° N and 5° S** of the Equator. Africa: the Congo Basin, southern Cameroon and Gabon. South America: the Amazon Basin. Asia: Malaysia and Indonesia.

2. Give five characteristics of the equatorial climate.

Answer: Hot all year (23 to 25 °C in every month); small annual range of temperature (less than 3 °C); heavy rain in almost every month (1,500 to 2,500 mm a year); convectional rain in the afternoon, with thunder; high humidity.

Practice: study the climate data of a station Y in southern Cameroon (approximate values).

Month	J	F	M	A	M	J	J	A	S	O	N	D
Temp. (°C)	25	25	25	25	24	24	23	23	24	24	24	25
Rain (mm)	40	80	150	190	210	160	60	90	230	280	130	40

3. Calculate the annual range of temperature and the total annual rainfall. Name the wettest month.

Answer: Range = highest − lowest = 25 − 23 = **2 °C**. Total rainfall = sum of the 12 months = **1,660 mm**. Wettest month: **October** (280 mm). The figures show a very small range (2 °C) and heavy rainfall in every month.

B. THE EQUATORIAL REGION: SOILS AND VEGETATION

4. Describe the equatorial vegetation and soils.

Answer: The forest is **evergreen**, with layers (emergents, canopy, under-canopy, shrubs, forest floor), hardwoods (sapele, iroko, mahogany, ebony) and climbers (lianas); mangroves grow in salty water on the coast. The soils are red or yellow **ferrallitic** soils; heavy rain washes the plant food away (**leaching**), the humus is thin, and the soil becomes poor after a few years of farming.

C. THE EQUATORIAL REGION: RESOURCES, ACTIVITIES AND PROBLEMS

5. Give resources, methods of exploitation and human activities.

Answer: Resources: forest (timber, firewood, fruits, medicines), water (Sanaga, Congo), minerals (oil, gas, gold, iron ore, bauxite), fertile land, wildlife. Exploitation: chainsaws and sawmills, dams at Edéa and Song Loulou, oil drilling near Kribi and Limbe, farms and plantations, national parks such as Dja. Activities: **shifting cultivation**, plantations (oil palm, rubber, bananas), lumbering, hunting, gathering, fishing, mining.

6. Give problems faced by man, problems caused by man and attempted solutions.

Answer: Faced: diseases (malaria, sleeping sickness), bad roads, thick forest, poor soils. Caused: **deforestation**, soil erosion, loss of wildlife, water pollution. Solutions: reforestation, national parks, health care (nets, drugs, vaccines), better roads, forest laws.

D. THE TROPICAL GRASSLAND (SAVANNA) REGION: LOCATION, CLIMATE, VEGETATION AND SOILS

7. Where is the savanna located?

Answer: Between **5° and 15° N and S** of the Equator. Africa: North Cameroon, the Sudan savanna and East Africa. South America: the Llanos and the Campos. Australia: the north.

8. Describe the savanna climate.

Answer: Hot all year (25 to 35 °C); **two seasons**: a wet season (May to October) and a dry season (November to April); rainfall of about 750 to 1,500 mm a year, in heavy storms with thunder; the Harmattan, a dry and dusty wind, blows in the dry season. Example: Garoua.

9. Describe the savanna vegetation and soils.

Answer: Vegetation: tall grass (elephant grass up to 3 m) with scattered trees (baobab, acacia, shea). Many trees lose their leaves in the dry season (deciduous); the **baobab** stores water in its trunk; thick bark protects trees from fire. Soils: red ferruginous soils rich in iron; laterite (a hard red crust used for roads and bricks); fertile black cotton soils that crack when dry; little humus because bush fires burn dead plants.

10. Compare the equatorial and the savanna climates.

Answer: Equatorial: 23–25 °C, rain all year (1,500–2,500 mm), no dry season, evergreen forest. Savanna: 25–35 °C, wet and dry seasons (750–1,500 mm), grass and scattered trees.

Quick quiz	Answer
Washing down of soil nutrients by heavy rain	**Leaching**
A hardwood of the equatorial forest	**Mahogany**

Tree that stores water in its trunk	**Baobab**
Latitudes of the savanna	**5° to 15° N and S**

E. PRACTICE OF COMPETENCE

Situation

Near Lomié, farmers clear new forest plots every two years because their old fields no longer produce enough. The chief does not understand why the soil becomes poor so quickly.

11. What is the problem raised in the situation?

Answer: The soils become poor quickly after the forest is cleared, which pushes farmers to destroy more forest (deforestation).

12. Propose three measures to solve it.

Answer: Practise agroforestry and plant cover crops; add compost or manure to the soil; replant trees and protect the remaining forest; leave the land to rest (fallow).

Exam tip: *In Part Two, Question 1 asks for the problem of the situation, Question 2 is answered with* ***Document 1****, and Question 3 asks you to propose your own solutions.* ***Document 2 has nothing to do with the situation: do not use it.***
