DIVINE GRACE COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY (DGCAST) – GAROUA

GEOGRAPHY REVISION SHEET – FORM TWO

First Sequence Evaluation, School Year 2026-2027 • Teacher: Mr KAMDEM Emmanuel

Lessons revised: Lesson 1 (Rapid growth), PW1 (Demographic indices), Lesson 2 (Uneven distribution), PW2 (Densities), Lesson 3 (Man in the equatorial zone)

A. KEY DEFINITIONS

1. Define: population, birth rate, death rate, natural growth, density, shifting cultivation, bush fallowing.

Answer: Population: the number of people living in a place at a given time. **Birth rate**: births per 1,000 people in one year (‰). **Death rate**: deaths per 1,000 people in one year (‰). **Natural growth**: the difference between births and deaths.

Density: people per km² (population ÷ area). **Shifting cultivation**: farming a plot for a few years, then moving to a new one when the soil is poor. **Bush fallowing**: leaving farmland to rest so that it becomes fertile again.

B. THE RAPID GROWTH OF THE WORLD'S POPULATION

2. Describe the evolution of the world population.

Answer: Fewer than 1 billion people until about 1800; about 2.5 billion in 1950; more than **8 billion in 2022**. Growth is now fastest in Africa and Asia.

3. Give four factors of the rapid growth of population and three consequences on natural resources.

Answer: Factors: a high birth rate; a falling death rate (vaccines, hospitals, clean water); a better food supply; early marriages and big families. Consequences: farmland becomes scarce; forests are cut; water becomes scarce and polluted; soils lose their fertility.

C. CALCULATION OF DEMOGRAPHIC INDICES (PRACTICE)

A town of **150,000** inhabitants with an area of **300 km²** recorded **5,400** births and **1,350** deaths in one year.

4. Write the formulas and calculate the birth rate and the death rate.

Answer: Birth rate = (births ÷ population) × 1,000 = (5,400 ÷ 150,000) × 1,000 = **36 ‰**. Death rate = (deaths ÷ population) × 1,000 = (1,350 ÷ 150,000) × 1,000 = **9 ‰**.

5. Calculate the natural growth rate and the population density.

Answer: Natural growth rate = (36 − 9) ÷ 10 = **2.7 %**. Density = 150,000 ÷ 300 = **500 people per km²**.

D. THE UNEVEN DISTRIBUTION OF THE WORLD'S POPULATION

6. Name densely and sparsely populated areas of the world.

Answer: Dense: East Asia, South Asia, Western Europe, West Africa, north-east USA. Sparse: hot deserts (Sahara), polar lands, high mountains, thick forests.

7. Give four factors of the uneven distribution of population.

Answer: Climate (mild climate with enough rain); relief and soils (flat land, fertile soils); water (rivers, lakes, coasts); economic factors (jobs, industries, ports, mines); social and political factors (services, security).

8. Classify the regions of Cameroon by population density.

Answer: High (over 100 per km²): Littoral, West, North-West, Far North. Moderate (20 to 100): Centre, South-West, North. Low (under 20): **East**, South, Adamawa.

E. MAN IN THE EQUATORIAL ZONE

9. Where is the equatorial zone and what is its climate?

Answer: Between about **5° N and 5° S** of the Equator: the Congo Basin, the Amazon Basin, South-East Asia and southern Cameroon. It is hot all year (25 to 27 °C), with heavy rain (more than 1,500 mm a year, in almost every month) and humid air.

10. Name the resources of the zone and the ways they are exploited.

Answer: Forest (timber, fruits, medicines, game): lumbering. Farmland: shifting cultivation with bush fallowing, and plantations of cocoa, coffee, oil palm and rubber. Minerals (oil, gold, iron, bauxite): mining. Water (fish, transport, hydro-electricity): fishing and dams.

11. Give four problems faced by man in the zone and four solutions.

Answer: Problems: dense forest; heavy rain and bad roads; poor soils (rain washes out the minerals); diseases such as malaria. Solutions: tarred roads; health centres and mosquito nets; fertilisers and improved seeds; reforestation.

Quick quiz	Answer
The birth rate is expressed …	**Per thousand (‰)**
Region of Cameroon with the lowest density	**The East**
Equatorial zone: latitudes	**5° N to 5° S**
Natural growth rate = …	**(birth rate − death rate) ÷ 10**

F. PRACTICE OF COMPETENCE

Situation
In a quarter of Garoua, families get bigger every year. Long queues form at the only borehole, classrooms are overcrowded and the last trees are cut for firewood. The quarter chief asks you for help.

12. What is the problem raised in the situation?

Answer: The rapid growth of the population puts heavy pressure on the resources and services of the quarter (water, schools, trees).

13. Propose three solutions.

Answer: Educate families on family planning and send girls to school; build more boreholes and classrooms; plant trees and use improved stoves to save firewood.

Exam tip: *In Part Two, Question 1 asks for the problem of the situation, Question 2 is answered with* ***Document 1****, and Question 3 asks you to propose your own solutions.* ***Document 2 has nothing to do with the situation: do not use it.***
